

***Amendment to the Claims***

1. (currently amended) A method of controlling the transmission timing of a wireless mobile transceiver in a wireless communications system, including:
  - transmitting to the mobile transceiver a time slot allocation indicating a sequential plurality of time slots which are not assigned to any mobile transceiver as available to the mobile transceiver in a time-slotted channel;
  - receiving a burst transmission from the mobile transceiver in a selected one of said time slots, the burst transmission including a time slot indication indicating the selected one of the time slots within which the burst was transmitted;
  - calculating from the timing of reception of said burst transmission a timing correction value for the mobile transceiver so as to synchronise the transmission timing of said mobile transceiver with a reference timing; and
  - transmitting said timing correction value to the mobile transceiver.

2. (canceled)

3. (previously presented) A method as claimed in claim 1 wherein said plurality of sequential time slots have a total length greater than the maximum variation in propagation delay from said mobile transceiver in said wireless communications system.

4. (currently amended) A method of controlling the transmission timing of a wireless mobile transceiver in a wireless communications system, including:
  - receiving at the mobile transceiver a time slot allocation indicating a sequential plurality of time slots which are not assigned to any mobile transceiver as available to the mobile transceiver in the channel;

selecting one of said time slots;  
transmitting from the mobile transceiver a burst transmission in said selected time slot, the transmission including a time slot indication indicating the selected time slot;  
receiving at the mobile transceiver a timing correction value derived from the timing of the burst transmission; and  
adjusting the timing of a subsequent transmission by the mobile transceiver according to said timing correction value.

5. (canceled)

6. (previously presented) A method as claimed in claim 4 wherein said selected time slot is selected randomly or pseudo-randomly.

7. (previously presented) A method of controlling the transmission timing of a wireless transceiver in a wireless communications system, including:  
transmitting a burst transmission from the transceiver;  
receiving at the transceiver a timing correction value; and  
controlling a subsequent transmission by the transceiver according to the timing correction value and according to a timing uncertainty value as a function of time elapsed since reception of the timing correction value, wherein the timing uncertainty value indicates a likely modification of the timing correction value.

8. (original) A method as claimed in claim 7, wherein the timing uncertainty value is determined by a timing uncertainty rate received by the transceiver.

9. (previously presented) A method as claimed in claim 7, wherein if the timing uncertainty value exceeds a predetermined limit, the transceiver is inhibited from transmission in a time slot allocated to that transceiver until a further timing correction value is received.

10. (canceled)

11. (previously presented) A wireless link signal for wireless transceiver communication comprising a data burst including in temporal sequence:  
an initial predetermined synchronisation sequence;  
a data field carrying the data content of the burst; and  
a final predetermined synchronisation sequence.

12. (previously presented) A wireless link signal for wireless transceiver communication comprising a data burst including in temporal sequence:  
a first predetermined synchronisation sequence;  
a data field carrying substantially all of the data content of the burst; and  
a second predetermined synchronisation sequence.

13. (previously presented) A signal as claimed in claim 11, wherein the burst includes an initial preamble preceding the first synchronisation sequence.

14. (previously presented) A signal as claimed in claim 11, wherein the burst is transmitted in a time-slotted channel.

15. (original) A signal as claimed in claim 14, wherein the channel comprises a plurality of slots sequentially separated by a guard band, wherein the length of the guard

band is less than the maximum relative timing error between transmissions in adjacent time slots.

16-25. (canceled)

26. (previously presented) A signal as claimed in claim 12, wherein the burst includes an initial preamble preceding the first synchronisation sequence.

27. (previously presented) A signal as claimed in claim 12, wherein the burst is transmitted in a time-slotted channel.

28. (previously presented) A signal as claimed in claim 27, wherein the channel comprises a plurality of slots sequentially separated by a guard band, wherein the length of the guard band is less than the maximum relative timing error between transmissions in adjacent time slots.

29. (previously presented) A method as claimed in claim 4, wherein said plurality of sequential time slots have a total length greater than the maximum variation in propagation delay in said wireless communications system.
